

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

This Story Sir R. Moray affirmed to have received from the Earl of Weynes, Brother in Law to the Lord Sinclair, as it was written to him from Scotland.

Of the Mineral of Liege , yielding both Brimstone and Vitriol, and the way of extracting them out of it, used at Liege.

The Account of this *Mineral*, and of the way of extracting both *Brimstone* and *Vitriol* out of it, was procured from *Liege*, by the lately mentioned Sir Robert Moray, and by him communicated to the Royal Society, as follows.

The *Mineral*, out of which *Brimstone* and *Vitriol* are extracted, is one and the same, not much unlike Lead-ore, having also oft times much Lead mingled with it, which is separated from it by picking it out of the rest. The Mines resemble our English Coal-Mines, dugg according to the depth of the *Mineral*, 15, 20, or more fathoms, as the Vein leads the Workmen, or the subterranean waters will give them leave, which in Summer so overflow the Mines, that the upper waters, by reason of the drought, not sufficing to make the Pumps goe, the Work ceases.

To make *Brimstone*, they break the Stone or Ore into small pieces, which they put into Crucibles made of Earth, five foot long, square and Pyramid-wise. The Entry is near a foot-square. These Crucibles are laid sloping, eight undermost, and seven above them, as it were betwixt them, that the Fire may come at them all, each having its particular Furnace or Oven. The *Brimstone* being dissolved by the violence of the heat, drops out at the small end of the Crucible, and falls into a Leaden-Trough or Receptacle, common to all the said Crucibles, through which there runs a continual Rivolet of cold water, conveyed thither by Pipes for the cooling of the dissolved Sulphur, which is ordinarily four hours in melting. This done, the Ashes are drawn out with a crooked Iron, and being put into an Iron Wheel-barrow, are carried out of the Hutt, and being

being laid in a heap, are covered with other elixed or drained Ashes, the better to keep them warm; which is reiterated, as long as they make *Brimstone*.

To make *Coperas* or *Vitriol*, they take a quantity of the said Ashes, and throwing them into a square planked pit in the Earth, some four foot deep, and eight foot square, they cover the same with ordinary water, and let it lye twenty four hours, or untill an Egge will swim upon the liquor, which is a sign, that it is strong enough. When they will boyl this, they let it run through Pipes into the Kettles, adding to it half as much Mother-water, which is that water, that remains after boyling of the hardned *Coperas*. The Kettles are made of Lead, $4\frac{1}{2}$ foot high, 6 foot long, and 3 foot broad, standing upon thick Iron Barrs or Grates. In these the Liquor is boyled with a strong Coal-fire, twenty four hours or more, according to the strength or weakness of the Lee or Water. When it is come to a just coasistence, the fire is taken away, and the boyled liquor suffered to cool somewhat, and then it is tapp'd out of the said Kettles, through holes beneath in the sides of them, and conveyed through wooden Conduits into several Receptacles, three foot deep and four foot long (made and ranged not unlike our Tan-pits) where it remaius fourteen or fifteen dayes, or so long till the *Coperas* separate it self from the water, and becomes icy and hard. The remaining water is the above-mentioned Mother-water; and the eliced or drained Ashes are the Dreggs, or *Caput mortuum*, which the Lee, whereof the *Vitriol* is made, leaves behind it in the planked Pitts.

A further Account of Mr. Boyle's Experimental History of Cold.

In the first Papers of these *Philosophical Transactions*, some promise was made of a fuller account, to be given by the next, of the *Experimental History of Cold*, composed by the Honourable Mr. *Robert Boyle*; it being then supposed, that this *History* would have been altogether printed off at the time of publishing the second Papers
